Risk Management

Google Cybersecurity Professional Certificate · Study Guide

A bank risk register scoring five threats by likelihood and severity, plus a home asset inventory exercise classifying assets by sensitivity level.

Track	Google Cybersecurity Professional Certificate
Course	Assets, Threats, and Vulnerabilities
Framework	Likelihood x Severity risk matrix
Analyst	Chayan Panchal

1 Operational Environment

The bank in this assessment sits in a coastal area with low crime rates, employs 100 on-premise and 20 remote staff, and serves 2,000 individual accounts and 200 commercial accounts. Its services are marketed through a professional sports team and 10 local businesses, and strict financial regulations require it to secure customer data and maintain sufficient daily cash reserves per Federal Reserve requirements.

NOTE Doing business with external partners (the sponsorship deal, local business marketing tie-ins) increases data exposure by introducing additional access points that could be compromised — a factor worth weighing even when those partnerships aren't the asset directly at risk.

2 Risk Register

Asset	Risk	Description	Likelihood	Severity	Priority
Funds	Business email compromise	Employee tricked into sharing confidential information	2	2	4
Funds	Compromised user database	Customer data is poorly encrypted	2	3	6
Funds	Financial records leak	A backup database server is publicly accessible	3	3	9
Funds	Theft	Bank safe left unlocked	1	3	3
Funds	Supply chain disruption	Delivery delays due to natural disasters	1	2	2

SCORING Priority Score = Likelihood x Severity, each rated 1-3. The financial records leak — a backup database server left publicly accessible — scores highest at 9 and needs to be addressed immediately; physical theft scores lowest given the low-crime location.

Risk matrix

	Low (1)	Moderate (2)	Catastrophic (3)
Certain (3)	3	6	9
Likely (2)	2	4	6
Rare (1)	1	2	3

3 Home Asset Inventory

A companion exercise applies the same risk-thinking to a home network: inventorying personal assets (devices, accounts, documents) and classifying each by sensitivity level, using a structured framework rather than an ad-hoc list — the same discipline as an organizational asset inventory, just scoped down to a single household.

NOTE The underlying principle carries over directly from the bank register: you can't prioritize protecting anything until you've inventoried what you actually have and ranked it by how sensitive or critical it is.

4 Quick Reference

Risk management — quick reference

Priority Score = Likelihood (1-3) x Severity (1-3)

1-3 Low priority

4-6 Medium priority

9 High priority – address immediately

Risk register fields: Asset | Risk | Description | Likelihood | Severity | Priority
